* Dermot Walsh, FRCPI, Russborough, Blessington, Co Wicklow

Dr Walsh was responsible for setting up the National Psychiatric In-patient Reporting System (NPIRS) in the early 1960s. He was Inspector of Mental Hospitals from 1987–2003 and served as psychiatric advisor to the Department of Health during this time. He was Director of the Mental Health Section of the Medico-Social Research Board and subsequently the Health Research Board (HRB) from 1969–2003. He remained in the HRB as Principal Investigator in the Mental Health Information Systems (MHIS) Unit until 2010.

HRB Statistics Series 25

Activities of Irish Psychiatric Units and Hospitals 2013

Antoinette Daly and Dermot Walsh*

About the HRB

The Health Research Board (HRB) is the lead agency supporting and funding health research in Ireland. We also have a core role in maintaining health information systems and conducting research linked to these systems. Our aim is to improve people's health, build health research capacity, underpin developments in service delivery and make a significant contribution to Ireland's knowledge economy.

Our information systems

The HRB is responsible for managing five national information systems. These systems ensure that valid and reliable data are available for analysis, dissemination and service planning. Data from these systems are used to inform policy and practice in the areas of alcohol and drug use, disability and mental health.

The **HRB Statistics Series** compiles data on problem alcohol and drug use, disability and mental health from a single point or period in time. Previous reports associated with this series are:

- *Activities of Irish Psychiatric Units and Hospitals* (1965–2005)
- *National Physical and Sensory Disability Database Committee Annual Reports* (2004–2006)
- *National Intellectual Disability Database Committee Annual Reports* (1996–2006)

The **Mental Health Information Systems** (MHIS) unit gathers data on patient admissions and discharges from psychiatric hospitals and units throughout Ireland. The data collected have been reported in the *Activities of Irish Psychiatric Services* since 1965 and continue to play a central role in the planning of service delivery. These findings inform national policy, health service management, clinical practice and international academic research in the area of mental health.

Acknowledgements

The MHIS unit would like to thank all our contacts in units and hospitals for submitting the information for this report and for their continuing commitment and dedication. We would also like to thank our colleagues Yvonne Dunne and Deirdre Hallissey for collecting and collating the information that is central to the report and to Sarah Craig, Head of Unit. We would also like to thank the Mental Health Specialists for their on-going support of the NPIRS database.

The following is the list of NPIRS contacts to whom we extend our thanks.

Glossary

Central Mental Hospital. The Central Mental Hospital, Dundrum, is administered by HSE Dublin Mid-Leinster but serves the country as a whole rather than a specified catchment area.

Health Research Board (HRB). The Health Research Board (HRB) was established in 1986 (under Statutory Instrument No. 279) to promote, assist, commission and conduct medical, health, epidemiological and health services research in Ireland. The board arose from the amalgamation of two former bodies, the Medical Research Council and the Medico-Social Research Board (MSRB).

Health Service Executive (HSE) Areas. The address from which each patient was admitted to hospital was used to allocate the patient to the corresponding Health Service Executive (HSE) area and the admission was rated accordingly. Thus, tabulations relating to HSE areas were calculated irrespective of whether or not the patient was admitted to a hospital administered by that area. Data on patients admitted to independent/private and private charitable centres were returned to the area in which they normally resided. A map outlining each HSE area and its respective catchment population according to the Census of Population 2012 (Central Statistics Office, www.cso.ie) is presented in Chapter 1.

ICD-10. The diagnostic groups in this report are based on the World Health Organization's (WHO) International Classification of Diseases categories (ICD-10) (WHO 1992).

In-patient days. In-patient days were the number of days spent in hospital from date of admission to date of discharge. It was calculated by subtracting date of admission from date of discharge, including time spent on transfer for medical or surgical purposes while still 'on the books' of psychiatric units and hospitals.

Legal status. The legal status reported throughout this report is that recorded on admission. Changes may occur in legal status following admission but this is not recorded by the NPIRS.

Length of stay. Length of stay is derived by calculating the amount of time spent in hospital between admission and discharge by subtracting date of admission from date of discharge, including time spent on transfer for medical or surgical purposes while still 'on the books' of psychiatric units and hospitals. It should be remembered that because of existing legislative provisions, a small number of involuntary patients may be discharged on trial but remain 'on the books' until formally discharged later.

Independent/private and private charitable centres. This term replaces the previously used term 'private hospitals'.

Socio-economic group. Patients were allocated to one of 11 socio-economic groups according to the Classification of Occupations of the Central Statistics Office (CSO) in the Census of Population 2012 (Central Statistics Office, www.cso.ie). Socio-economic group is determined by a person's occupation or their former occupation where the patient was unemployed or retired. If a patient was a student or engaged in house duties, the occupation of the head of household or spouse or guardian is used to determine socio-economic group. If such persons (students and/or persons engaged in house duties) are not members of a family unit and/or are living alone (e.g. widowed grandparents), they are assigned to the unknown group.

Executive summary

National admissions

There were 18,457 admissions to Irish psychiatric units and hospitals in 2013, representing a rate of 402.3 per 100,000 total population. This is an increase of 284 admissions from 2012 (18,173) and also a slight increase in the rate of admissions from 396.1 in 2012 to 402.3 in 2013. There was a decrease in the number of first admissions from, 6,130 in 2012 to 6,055 in 2013 and the rate of first admissions similarly decreased from 133.6 per 100,000 in 2012 to 132.0 in 2013. Re-admissions increased from 12,043 in 2012 to 12,402 in 2013, with the proportion of admissions that were re-admissions also increasing ever so slightly from 66% in 2012 to 67% in 2013. The re-admission rate increased from 262.5 per 100,000 in 2012 to 270.3 in 2013. Approved centres reported an additional ten persons presenting for admission in 2013 but who were referred/returned home without being admitted. The overall increase in admissions was due in large part to an increase in admissions in the independent/private and private charitable centres.

The proportion of females, at 51%, slightly outnumbered that of males, at 49%, with a similar pattern observed for rates, with females having a higher rate than males, at 403.7 per 100,00 compared with 400.8 for males. The 55–64 year age group had the highest rate of all admissions, at 590.1 per 100,000, followed by the 45–54 year age group, at 587.2, and the 65–74 year age group, at 546.5. The 75 and over age group had the lowest rate of all admissions, at 450.2 per 100,000. The 18–19 year age group had the highest rate of first admissions, at 263.3, followed by the 20–24 year age group, at 237.5, and the 75 year and over group, at 194.3 per 100,000. The mean age at admission was 45 years (minimum 14 years and maximum 97 years).

Single persons accounted for over half (55%) of all admissions, married persons accounted for 27%, widowed accounted for 4% and divorced persons also accounted for 4%. Despite accounting for just 4% of all admissions, divorced persons had the highest rate of all admissions, at 787.3 per 100,000, followed by widowed persons, at 416.1 and single persons, at 407.7. Married persons had the lowest rate of all admissions, at 288.9 per 100,000. Similarly, married persons had the lowest rate of first admissions, at 108.0 per 100,000, while divorced persons had the highest rate, at 175.5.

As in previous years, the unskilled occupational group had the highest rate of all (802.2) and first admissions (211.9), although caution must be exercised in interpreting socio-economic group as 44% of occupations were returned as unknown or unspecified, making assignment to a socio-economic group impossible. Forty per cent

of all admissions in 2013 were returned as unemployed, 26% as employed, 10% as retired, 6% as students, 6% as engaged in house duties, while 12% were returned as unknown.

There were 245 admissions with no fixed abode in 2013. Sixty-eight per cent of these were male, 79% were single, 28% had a diagnosis of schizophrenia, 18% had a diagnosis of other drug disorders and 13% had a diagnosis of alcoholic disorders. In terms of ethnicity, 88% of all admissions in 2013 were returned as 'White Irish', 5% were returned as 'Any Other White Background' (including White Irish Traveller, White Roma and Any Other White Background) and 2% were distributed amongst various other ethnic groups. Five per cent were returned as 'Unknown/unspecified'.

The most common diagnosis recorded for all admissions was depressive disorders, accounting for 28% of all, 30% of first and 28% of re-admissions, and accounting for the highest rate of all (114.5) and first (39.8) admissions. Schizophrenia accounted for 20% of all, almost 13% (12.5%) of first and 24% of re-admissions and had the second-highest rate of all admissions (80.4).

Involuntary admissions accounted for 11% of all and 12% of first admissions, a marginal increase in the proportion of involuntary first admissions from 11% (10.9%) in 2012. The rate of involuntary all admissions increased from 41.9 in 2012 to 44.4 per 100,000 in 2013, while that for first admissions also increased from 14.5 in 2012 to 15.7 per 100,000 in 2013. Admissions for schizophrenia had the highest rate of involuntary admission, at 19.4 per 100,000, followed by mania, at 7.9, and depressive disorders, at 4.7.

National discharges and deaths

There were 18,335 discharges from, and 144 deaths in, Irish psychiatric units and hospitals in 2013. Males accounted for 57% of all deaths in 2013, and 78% of those who died were aged 65 years and over. Ninety-two per cent of all those admitted in 2013 and 94% of first admissions in 2013 were discharged in 2013.

Almost one-third (30.4%) of all discharges took place within one week of admission, 18% occurred within one to two weeks of admission, 20% occurred within two to four weeks of admission and a further 26.5% occurred within one to three months of admission. Overall, ninety-five per cent of all discharges occurred within three months of admission.

Over half of discharges with a primary discharge diagnosis of other drug disorders (51%), 50% of discharges with behavioural and emotional disorders of childhood and adolescence and 48% of those with personality and behavioural disorders occurred

within one week of admission. Over 90% of discharges for most disorders occurred within three months of admission with the exception of organic mental disorders (82%), and intellectual disability (74%).

The average length of stay for all discharges in 2013 was 71.4 days, while that for discharges up to one year in hospital was 25.3 days, with a median length of stay of 14 days for both analyses. Discharges with a primary discharge diagnosis of organic mental disorders had the longest average length of stay (excluding discharges with a length of stay of one year or more), at 41.6 days (median 20 days), accounting for 5% of in-patient days and just 3% of discharges in 2013. Other drug disorders had the shortest average length of stay at 13.6 days (median 6 days).

HSE Areas

Twenty-eight per cent of all admissions in 2013 were resident in Dublin Mid-Leinster, almost 25% (24.5%) were resident in HSE West, 24% were resident in HSE South and 22% were resident in Dublin North-East. Less than one per cent of admissions were recorded as non-residents on admission. The highest rate of all admissions was recorded for HSE West, at 418.0 per 100,000, followed by Dublin North-East, at 407.5, and HSE South, at 396.8. Dublin Mid-Leinster had the lowest rate of all admissions, at 386.3 per 100,000. Dublin North-East had the highest rate of first admissions, at 137.2 per 100,000, followed by Dublin Mid-Leinster, at 133.5, and HSE South, at 129.8. HSE West had the lowest rate of first admissions, at 123.7 per 100,000.

The proportion of re-admissions ranged from 70% of all admissions resident in HSE West to 66% of admissions resident in Dublin North-East. HSE West had the highest rate of re-admissions, at 294.3 per 100,000, followed by Dublin North-East, at 270.4, and HSE South, at 267.0. Dublin Mid-Leinster had the lowest rate of re-admissions, at 252.8 per 100,000.

Females had higher rates of all admissions than males in Dublin Mid-Leinster and Dublin North-East, with rates of 401.0 and 418.5 respectively, compared with rates of 371.1 for males in Dublin Mid-Leinster and 396.3 in Dublin North-East. Males had higher rates of all admissions than females in HSE South, at 411.0 and HSE West, at 426.4, compared with 382.7 per 100,000 for females in HSE South and 409.6 in HSE West.

The 55–64 year age group had the highest rate of all admissions in Dublin Mid-Leinster, at 621.6 per 100,000, and Dublin North-East, at 642.7. The 20–24 year age group had the highest rate in HSE South, at 595.1 per 100,000, and HSE West, at 664.6. Amongst first admissions, the 18–19 year age group had the highest rate of admission

in Dublin Mid-Leinster, at 251.7 per 100,000, Dublin North-East, at 282.7, and HSE West, at 298.7. The 20–24 year age group had the highest rate of admission in HSE South, at 264.5.

Depressive disorders had the highest rate of all and first admissions across all four HSE areas in 2013, with rates for all admissions ranging from 136.4 per 100,000 in HSE West to 100.9 in Dublin North-East, while first admissions rates ranged from 46.5 in HSE West to 34.6 in Dublin North-East. Rates of all admissions for schizophrenia were second-highest amongst all HSE areas with rates ranging from 83.5 per 100,000 in HSE West to 78.3 in Dublin Mid-Leinster.

Twelve per cent of all admissions resident in Dublin North-East were involuntary, 11% in HSE South and 11% in HSE West and 10% in Dublin Mid-Leinster were involuntary. Fourteen per cent (13.6%) of first admissions in Dublin North-East, almost 14% (13.5%) in HSE South, 10% in Dublin Mid-Leinster and 10% in HSE West were involuntary. The highest rate of involuntary all admissions was observed for Dublin North-East, at 48.7 per 100,000, followed by HSE West, at 45.3, HSE South, at 44.8, and Dublin Mid-Leinster, at 39.0.

Almost one-third of all discharges in each HSE area in 2013 occurred within one week of admission: 31% in HSE South, 31% in HSE West, almost 31% (30.5%) in Dublin North-East and almost 30% (29.5%) in Dublin Mid-Leinster. Over 94% of discharges in all areas occurred within three months of admission.

Average length of stay for all discharges was longest in Dublin North-East, at 100.8 days (median 14 days), followed by HSE South, at 76.3 days (median 14 days), and Dublin Mid-Leinster, at 65.1 days (median 16 days). HSE West had the shortest average length of stay for all discharges, at 47.7 days (median 13 days). When discharges of one year or more were excluded, average length of stay was longest for Dublin Mid-Leinster, at 27.0 days (median 16 days), followed by Dublin North-East, at 26.1 days (median 14 days), and HSE South, at 25.0 days (median 14 days). HSE West had the shortest average length of stay for discharges up to one year, at 23.0 days (median 13 days).

Counties

There were wide variations in admission rates between counties in 2013. All admission rates were highest for counties Sligo (516.9), Roscommon (496.4), Kerry (468.0) and Laois (465.5). Monaghan had the lowest rate of all admissions, at 188.5 per 100,000. Westmeath had the highest rate of first admissions, at 164.8 per 100,000, followed by Dublin, at 148.9, Laois, at 147.7, and Kerry, at 145.0. Monaghan had the lowest rate of first admissions, at 61.2 per 100,000.

Non-residents

There were 54 admissions for non-residents in 2013, no change from 2012. Thirty-nine per cent of admissions for non-residents had an address originating in Northern Ireland, 30% had an address originating in England, 11% in the USA, 4% in France and 4% in Germany, with the remaining distributed amongst various other countries. Twenty-six per cent of non-residents had a primary diagnosis of schizophrenia, 24% had a diagnosis of mania, 20% had a diagnosis of depressive disorders and 7% had a diagnosis of personality and behavioural disorders.

Hospital type

In 2013, 56% (55.6%) of all admissions were to general hospital psychiatric units, 24% were to independent/private and private charitable centres and 20% were to psychiatric hospitals/continuing care units (including the Central Mental Hospital, Dundrum; Carraig Mór, Cork; St Joseph's Intellectual Disability Service, Portrane; and the Phoenix Care Centre, Dublin). Re-admissions accounted for 69% of all admissions to psychiatric hospitals/continuing care units, 67% of all admissions to general hospital psychiatric units and 66% of all admissions to independent/private and private charitable centres.

Males accounted for over half of all and first admissions to general hospital psychiatric units and psychiatric hospitals/continuing care units; 52% of all admissions and 56% of first admissions to general hospital psychiatric units; 54% of all admissions and almost 57% (56.5%) of first admissions to psychiatric hospital/continuing care units. In contrast, a much higher proportion of all admissions to independent/private and private charitable centres were female, at 61%, with females also accounting for 58% of first admissions to independent/private and private charitable centres.

Admissions to independent/private and private charitable centres (some of which provided specialised services for the elderly) had an older age profile than either general hospitals psychiatric units or psychiatric hospitals/continuing care units; 60% of admissions to independent/private and private charitable centres were aged

45 years and over compared with 43% in general hospital psychiatric units and 48% in psychiatric hospitals/continuing care units. The mean age at admission in independent/private and private charitable centres was 49.5 compared with 45.3 in psychiatric hospitals/continuing care units and 42.9 in general hospital psychiatric units.

One-third of all (35%) and first (32%) admissions to independent/private and private charitable centres had a primary admission diagnosis of depressive disorders. The comparable figures for general hospital psychiatric units were 29% of all and 32% of first, while those for psychiatric hospitals were 20% of all and 24% of first admissions. Just 7% of admissions to independent/private and private charitable centres were for schizophrenia, compared with 23% of admissions to general hospital psychiatric units and 28% of admissions to psychiatric hospitals/continuing care units. Alcoholic disorders accounted for 13% of admissions to independent/private and private charitable centres, 7% of admissions to general hospital psychiatric units and 5% of admissions to psychiatric hospitals/continuing care units.

Involuntary admissions accounted for 19% of all admissions to psychiatric hospitals/continuing care units, 12% to general hospital psychiatric units and just 2% to independent/private and private charitable centres. The pattern for involuntary first admissions was similar, with almost 23% (22.5%) to psychiatric hospitals/continuing care units, 12% to general hospital psychiatric units and just 2.5% to independent/private and private charitable centres.

Over one-third of all discharges from both general hospital psychiatric units (36%) and psychiatric hospitals (34%) occurred within one week of admission, compared with 14% from independent/private and private charitable centres. Over half of all discharges from general hospital psychiatric units (57%) and from psychiatric hospitals/continuing care units (52%) occurred within two weeks of admissions compared with 25% from independent/private and private charitable centres.

Average length of stay for all discharges was longest in psychiatric hospitals/continuing care units, at 229.5 days (median 13 days), followed by independent/private and private charitable centres, at 45.9 days (median 29 days), and general hospital psychiatric units, at 23.3 days (median 11 days). When discharges of one year or more were excluded independent/private and private charitable centres had the longest average length of stay, at 33.3 days (median 29 days), followed by psychiatric hospitals/continuing care units, at 26.6 days (median 11.5 days), and general hospital psychiatric units, at 21.4 days (median 11 days).

Child and adolescent admissions

There were 415 admissions for under 18s in 2013 to all hospital types (general hospital psychiatric units, psychiatric hospitals/continuing care units and child and adolescent in-patient units), a decline of 23 since 2012 (438). Seventy-six per cent (317) of all admissions for under 18s were first admissions. There were 317 admissions to dedicated child and adolescent in-patient units and 74% of these (236) were first admissions. There were 98 admissions for under 18s to adult psychiatric hospitals.

Sixty-four per cent of all and 63% of first admissions for under 18s were females. Two-thirds were aged 16–17 years of age on admission (37% were aged 17 years and almost 32% (31.5%) were aged 16 years); 15% were aged 15 years, 11% were aged 14 years, 4% were aged 13 years and 1% were aged 12 years or younger. Females accounted for 69% of all and 69% of first admissions to dedicated child and adolescent in-patient units. Thirty per cent of all admissions to child and adolescent in-patient units were aged 17 years of age on admission, a further 30% were aged 16 years, 19% were aged 15 years, 14% were aged 14 years, 5% were aged 13 years and 1% were aged 12 years or younger.

Of the 98 admissions to adult psychiatric units and hospitals, 56 were aged 17 years, a further 36 were aged 16 years, 3 were aged 15 years and a further 3 were aged 14 years.

Thirty-six per cent of all admissions for under 18s had a primary admission diagnosis of depressive disorders, 13% had a diagnosis of schizophrenia, almost 12% (11.5%) had a diagnosis of eating disorders and 9% had a diagnosis of neuroses. Females accounted for 65% of all admissions with a primary diagnosis of depressive disorders, 72% of all admissions with mania, 92% of all admissions with eating disorders and 64% of all admissions with neuroses. Males accounted for 60% of all admissions with a primary diagnosis of schizophrenia and 60% of those with other drug disorders.

Four per cent of all admissions (16 admissions) for under 18s were involuntary in 2013 and 3% of first admissions (9 admissions) were involuntary. Forty-four per cent of all involuntary admissions for under 18s had a primary admission diagnosis of schizophrenia, 25% had a diagnosis of depressive disorders and 19% had a diagnosis of mania.

Seventy-six per cent of all admissions for under 18s were to dedicated child and adolescent units, 20% were to general hospital psychiatric units and 3% were to psychiatric hospitals/continuing care units. There were no admissions to independent/private and private charitable centres.

Eighty-five per cent of under 18s admitted in 2013 were discharged in 2013. Of those admitted and discharged in 2013, 24% were discharged within one week, 10% were discharged within one to two weeks, 14% were discharged within two to four weeks, 40% were discharged within one to three months and 12% were discharged within three months to one year.

The average length of stay for all under 18s admitted and discharged in 2013 was 42.5 days (median 29 days). The average length of stay for those admitted and discharged in 2013 was longest in child and adolescent units, at 54.8 days (median 48 days), followed by general hospital psychiatric units, at 9.8 days (median 4 days) and psychiatric hospitals/continuing care units, at 9.3 days (median 11 days).

Ten-year review

There has been a 17% decline in admissions in the ten-year period from 2004–2013, from 22,400 in 2004 to 18,457 in 2013. Re-admissions have shown a greater level of decline during this period, at 24%, from 16,232 in 2004 to 12,402 in 2013. The overall number of first admissions has not changed greatly over the last 40 years or so, with a mere 2% decline from 2004–2013, from 6,168 in 2004 to 6,055 in 2013.

In the ten-year period from 2004–2013 admissions to general hospital psychiatric units increased from 47% to 56%, admissions to independent/private and private charitable centres increased from 18% to 24%, while admissions to psychiatric hospitals/continuing care units decreased from 35% to 20%.

Despite a decline in involuntary admissions during some of the ten-year period from 2004–2013, proportions in 2013 are now similar to those in 2004, prior to the introduction of the Mental Health Act 2001. In 2004, 11% of all and 13.5% of first admissions were involuntary; in 2013 11% of all and 11.8% of first admissions were involuntary, pointing to very little overall change in this period, despite reductions in the intervening period.

1 Introduction and Background Information

We are pleased to present our annual report on the activities of Irish psychiatric in-patient services for the year 2013, the 43rd consecutive year for which data has been returned to the National Psychiatric In-patient Reporting System (NPIRS) and presented for publication. As always, we pay tribute to all our NPIRS contacts in approved centres throughout the country without whose cooperation and commitment none of this would be possible. The annual reports produced from the database continue to play a key role in the planning of service delivery. National and regional bulletins capturing data for the HSE areas, along with an in-patient census carried out every three years, are also produced from the database. The database also provides data on Performance Indicators (PIs) for the mental health services which are used to monitor targets in certain key areas of the services.

The NPIRS database produces high-quality, reliable and timely data quarterly and annually. The HRB Strategic Business Plan 2010–2014 outlined its commitment to carrying out an evaluation of NPIRS to ensure that the information system was of high quality and fit-for-purpose and following on from this an independent audit of the database was carried out in 2011. The audit reported an accuracy rate of 97.8%, which is high by international standards. Similarly, completeness rates were exceptionally high, at 99%. The personal relationship between the NPIRS team in the HRB and the NPIRS contact people in each approved centre was the single most important factor in producing complete and accurate data and this is something that the NPIRS Team values highly. The full report of the audit findings is available for download at http://www.hrb.ie/uploads/media/Evaluation_of_the_HRB_NPIRS.pdf.

The NPIRS Team liaises closely with all its stakeholders involved in the collection of mental health information. The unit continuously strives to review and update the database and the variables collected in terms of their relevance to the mental health services. The NPIRS data standards are reviewed annually along with the NPIRS training manual. Training and visits to approved centres continued in 2013, with further training and visits planned in 2014.

The NPIRS Team continues to work closely with the Mental Health Commission (MHC). A Memorandum of Understanding (MOU) was signed by the HRB and the MHC in 2008, allowing for cooperation in areas of mutual interest regarding mental health information and for close liaison between the two agencies in an effort to avoid, where possible, areas of duplication in the collection of mental health information. As part of the MOU, the HRB agreed to collect data for NPIRS from all centres approved under the

Mental Health Act 2001. As new centres become approved, they are contacted by the NPIRS Team to request submission of activity data to the NPIRS. Another key facet of the MOU was the agreement by the HRB to undertake a psychiatric in-patient census every three years, commencing in 2010. The results of the most recent census are available in the *Irish Psychiatric Units and Hospitals Census 2013* (Daly and Walsh 2014).

Data in this report were obtained from the NPIRS database. On the advice of the *Commission of Enquiry on Mental Illness* (Department of Health 1966), the Department of Health carried out a census of patients resident in Irish psychiatric hospitals on 31 March 1963, and information on all admissions, discharges and deaths thereafter was collected locally and returned to the Department. On the establishment of the Medico-Social Research Board (MSRB), the census and admission data were transferred to that organisation for analysis and publication. The MSRB published the results of the 1963 psychiatric in-patient census (Walsh 1971), along with a composite publication of data for 1965–1969 (O’Hare and Walsh 1972).

In 1971, the MSRB revised and improved this reporting from in-patient psychiatric facilities, commencing with a census on 31 March of that year. Subsequently, the MSRB, and later its successor, the Health Research Board (HRB), continued the series of annual activities reports on admissions, discharges and deaths and continued decennial censuses, the most recent of which was carried out on 31 March 2013 (Daly and Walsh 2014).

This report presents cross-sectional data on admissions, discharges and deaths for psychiatric in-patient facilities in Ireland in 2013. Data are presented nationally, regionally (by HSE area), and locally (by county, by hospital type and by individual unit and hospital). Data on admissions for children and adolescents, i.e. those under 18 years of age and those admitted to in-patient child and adolescent services, are presented separately in Chapter 5. Data on admissions to the dedicated child and adolescent units (CAMHS, Galway; Linn Dara Child and Adolescent In-patient Unit, Dublin; Ginesa Unit, St John of God Hospital, Dublin; St Joseph’s Adolescent In-patient Unit; Willow Grove Adolescent In-patient Unit; and Éist Linn Child and Adolescent In-patient Unit, Cork) are included in that chapter, along with data on admissions to units and hospitals for persons under 18.

Comparative data for 2012 used throughout the report are from the publication *Activities of Irish Psychiatric Units and Hospitals 2012: Main Findings* (Daly and Walsh 2013) and rates reported are per 100,000 total population. All tables referred to in the text are located at the end of each chapter.

More detailed analysis of the data presented in this report is available on request.

A data request form including the terms and conditions concerning the use of data supplied from the NPIRS, along with an information document regarding the database, *Information for users of the NPIRS database*, can be downloaded from the HRB website www.hrb.ie. This information document outlines the variables collected and records changes in the database over the years. A privacy and confidentiality policy document entitled *Privacy and Confidentiality Policy relating to data held in the Mental Health Information Systems Unit (MHIS Unit) including procedures for the request and release of data* is also available on the HRB website (www.hrb.ie) and it is advised that this document be consulted before requests for data are submitted to the MHIS Unit. Interactive tables containing data for each year are available at http://www.cso.ie/px/pxeirestat/pssn/hrb/homepagefiles/hrb_statbank.asp. This allows the user to access readily-available data from the database over the last number of years. This exciting initiative was developed in conjunction with the CSO and we plan to expand the number of years available for users and to also upload the in-patient census data to this site.

Interactive tables containing data for each year are available at http://www.cso.ie/px/pxeirestat/pssn/hrb/homepagefiles/hrb_statbank.asp. This allows the user to access readily-available data from the database over the last number of years. This exciting initiative was developed in conjunction with the CSO and we plan to expand the number of years available for users and to also upload the in-patient census data to this site.

Data coverage and collection

Data on admissions to, and discharges from, 69 general hospital psychiatric units, psychiatric hospitals, independent/private and private charitable centres, child and adolescent units and the Central Mental Hospital (CMH) are included in this report. A breakdown of each hospital type for 2013 is presented in Table 1.1.

Table 1.1 Number of hospitals by hospital type

Hospital type	Number
General hospital psychiatric units	21
Psychiatric hospitals/continuing care units	31
Independent/private and private charitable centres	6
Child and adolescent units	6
Central Mental Hospital	1
Carraig Mór, Cork ^a	1
St Joseph's Intellectual Disability Service ^b	1
Phoenix Care Centre, Dublin ^c	1
Total	69

^a Carraig Mór is an intensive care and rehabilitation unit.

^b St Joseph's Intellectual Disability Service is located at St Ita's Hospital – Mental Health Services, Portrane.

^c Phoenix Care Centre, Dublin is an intensive care service with a catchment area covering Dublin city and county, extending to counties Louth, Meath, Cavan and Monaghan, and southwards to county Wicklow (excluding West Wicklow).

Hospitals and units included in this report are all those on the Register of Approved Centres under the Mental Health Act 2001. Two new approved centres opened in 2013, while two also closed. Table 1.2 below outlines the centres which opened and closed during the year.

Table 1.2 Approved centres which opened and closed during 2013

Approved centres opened during 2013	Approved centres closed during 2013
Phoenix Care Centre, Dublin – 17th May 2013	St Brendan's Hospital, Dublin – 23rd May 2013
Selskar House, Farnogue Residential Healthcare Unit, Wexford – 2nd May 2013	St Senan's Hospital, Enniscorthy – May 2013

As in previous years a number of issues with various hospitals/centres should be noted. The original date of admission for long-term patients transferred from St Loman's Hospital, Mullingar, to Cluain Lir Care Centre, Mullingar, was preserved to maintain their length of stay in the in-patient services. Similarly, discharges from Selskar House may include patients who were originally admitted to St Senan's Hospital, Enniscorthy and discharges from Heywood Lodge, Clonmel may include patients originally admitted to St Luke's Hospital, Clonmel. Phoenix Care Centre, which opened in May 2013, facilitated the transfer of patients from St Brendan's Hospital, which closed during 2013. This new centre covers the catchment area of Dublin city and county, extending to counties Louth, Meath, Cavan and Monaghan, and southwards to county Wicklow (excluding West Wicklow).

In 2013, six beds in the Department of Psychiatry, Midland Regional Hospital, Portlaoise, were allocated to patients from Lakeview Unit, Naas General Hospital. As this report is activity-based, admissions for these patients from Lakeview Unit are included in figures for the Midland Regional Hospital, Portlaoise.

In 2013, admissions to the Cluain Mhuire Service include admissions where private health insurance was invoked. Prior to 2012, these admissions were not included as admissions to Cluain Mhuire but were included as private admissions to St John of God Hospital (at year end in the NPIRS annual Activities report). Thus, an increase in admissions to Cluain Mhuire may be noticed in comparison with previous years.

Differences in data reported for child and adolescent admissions should be noted between the MHC's annual inspectorate report (Mental Health Commission 2014) and data in this report. Admissions for children and adolescents in this report include all admissions for persons under 18 years of age, regardless of their marital status, whereas the MHC's data on admissions for children and adolescents include admissions for children as defined under the Mental Health Act 2001, i.e. a child is defined as a person under the age of 18 years other than a person who is or has been married.

Data for the NPIRS were returned quarterly to the MHIS Unit of the HRB, either electronically or manually, according to agreed specifications. With the manual system, completed forms were returned to personnel at the HRB in accordance with procedures and practices established over a number of years. Personnel at the HRB code and process the data and maintain on-going liaison with hospital personnel. The admission and discharge form used to collect data from hospitals is presented in Appendix 1.

Quality assurance and validation of data

Data received from units and hospitals for the NPIRS are subjected to various in-built and manual quality assurance and validation measures, according to policies and procedures employed by the MHIS. Data are cleaned and validated upon receipt and import of data into the database, prior to the return of quarterly status reports to units and hospitals, prior to the return of annual status reports, and at year end in preparation for this report. All units and hospitals are required to sign off on final admission and discharge data for the year in advance of the preparation of this report.

Legal status

The legal status recorded by NPIRS is that recorded on admission, and while changes may occur in legal status following admission, this is not recorded by the NPIRS. It is important to note that data on legal status presented in this report differs from that reported by the MHC (Mental Health Commission 2014). Data contained here do

not include data on Form 13 – Admission Order to Detain a Voluntary Patient (Adult) – whereas MHC figures do. This is the re-grading of the legal status of a voluntary patient to involuntary.

Transfers

NPIRS does not record information on transfers because under Sections 20 and 21 of the Mental Health Act 2001, transfers of detained patients either to another approved centre or to the Central Mental Hospital (CMH) remain patients of the centre from which they are transferred. Transfers to the CMH (the only centre so far designated for the reception of such transfers) from the courts and prisons are regulated by the Criminal Law Insanity Act 2006. Patients detained in approved centres can be transferred to the CMH but only following authorisation by a mental health tribunal as provided for by the Mental Health Act 2001.

Computation of rates

The rates accompanying numerical data in this report were calculated using the Census of Population 2011 (Central Statistics Office 2012). All data were rated to the total population. In previous years, rates were calculated per 100,000 population aged 16 years and over and also per 100,000 population aged 15 years and over. However, in more recent years, it was decided to revert to using total population as the denominator as this is the standard used internationally and it thus allows comparative analysis.

Population figures for 2011 for HSE areas by socio-economic group could not be used to calculate rates because the population figures for socio-economic groups were not available by HSE areas as the census data produced by the CSO for socio-economic groups by electoral divisions (EDs) related to the socio-economic group of the reference person/household rather than every person resident in the state on census night. Thus, it was not possible to calculate the socio-economic group for the total population for each HSE area.

Health Service Executive (HSE) Areas

The composition of HSE areas and the Mental Health Catchment Areas (MHCAs)/Local Health Offices (LHOs) (with which MHCAs are generally coterminous) that comprise HSE areas, consist of EDs. Population figures using the 2011 census of population for the HSE areas have been calculated using previously agreed EDs for each area. As mentioned above, population figures for socio-economic groups were not available by HSE area because these data by EDs related to the socio-economic group of the reference person/household rather than every person resident in the state on census night.

All LHOs were requested to confirm their agreement with the updated population figures and, although confirmation for some areas remained outstanding at the time of production of this report, the figures were used as they were based on previously agreed configurations.

In this report, the address from which a person was admitted was used to assign them to a HSE area. Thus, HSE area refers to the HSE area of residence of the person. In contrast, HSE area, as reported by the MHC, is determined by the location of the approved centre to which a person was admitted, i.e. HSE area of hospitalisation. Thus, data on involuntary admissions by HSE areas presented in this report differ from those reported by the MHC due to differences in assigning persons to a HSE area.

Population figures based on CSO census data for 2011 for each HSE area are presented below in Table 1.3. The four HSE areas are roughly equal in terms of the total population.

Table 1.3 Health Service Executive Areas population

	Males	Females	Total
Dublin Mid-Leinster	664,578	686,977	1,351,555
Dublin North-East	502,376	516,159	1,018,535
South	563,939	569,919	1,133,858
West	541,806	542,498	1,084,304
Total	2,272,699	2,315,553	4,588,252

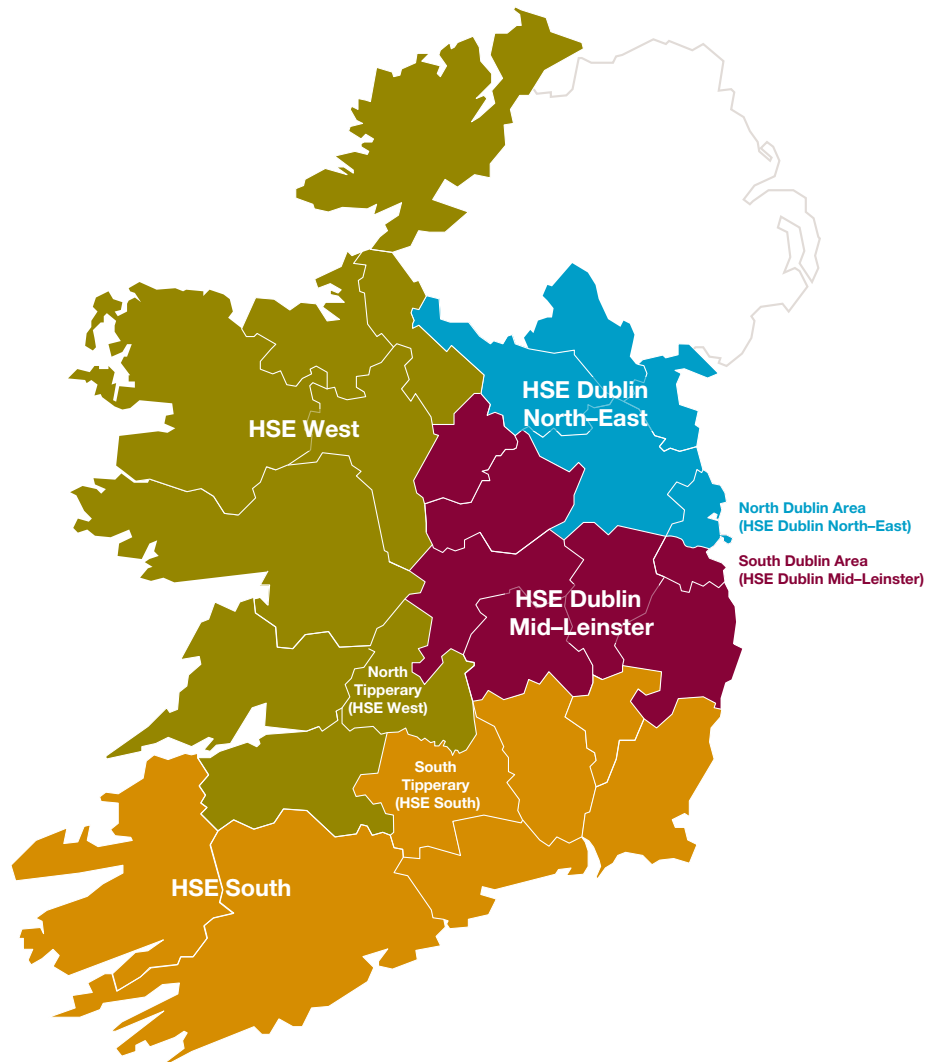

Figure 1.1 Health Service Executive Areas 2013

HSE Dublin Mid-Leinster – Total Population: 1,351,555. Includes Cluain Mhuire (South County Dublin), Area 2 (Dublin South-East), Area 3 (Dublin South), Areas 4 and 5 (Dublin South and South-West), Area 9 (Kildare and West Wicklow), Area 10 (East Wicklow), Laois/Offaly, Longford/Westmeath.

HSE Dublin North-East – Total Population: 1,018,535. Includes Area 6 (Dublin North-West), Area 7 (Dublin North), Area 8 (North County Dublin), Louth/Meath, Cavan/Monaghan.

HSE South – Total Population: 1,133,858. Includes North Lee, South Lee, North Cork, West Cork, Kerry, Waterford/Wexford, Carlow/Kilkenny/South Tipperary.

HSE West – Total Population: 1,084,304. Includes East Galway, West Galway, Mayo, Roscommon, Sligo/Leitrim, Donegal, Limerick, Clare.

Diagnosis

The diagnostic groups in this report are based on the WHO International Classification of Diseases categories (ICD-10, WHO 1992) and are presented in Table 1.4. From 2004, the ICD-10 diagnostic codes were assembled by us into new, more appropriate groupings. Therefore, some groups are not entirely comparable with diagnostic categories used prior to the 2004 report. Only three of the new categories are directly comparable to the old categories: alcoholic disorders, other drug disorders and intellectual disability.

Eating disorders, developmental disorders, and behavioural, emotional disorders of childhood and adolescence are presented as individual entities, whereas previously these three categories were included in the neuroses and personality disorder groupings. However, it should be pointed out that organic, schizophrenic, depressive and manic conditions arising in childhood and adolescence are included in the 'F' codes appropriate to these disorders and are not presented as disorders of childhood and adolescence. Finally, ICD-10 uses the term 'mental retardation', but our grouping is of 'intellectual disability' to accord with current Irish usage.

Table 1.4 ICD-10 diagnostic groups

ICD-10 diagnostic group	ICD-10 code
1 Organic disorders	F00-09
2 Alcoholic disorders	F10
3 Other drug disorders	F11-19, F55
4 Schizophrenia, schizotypal and delusional disorders	F20-F29
5 Depressive disorders	F31.3, F31.4, F31.5, F32, F33, F34.1, F34.8, F34.9
6 Mania	F30, F31.0, F31.1, F31.2, F31.6, F31.7, F31.8, F31.9, F34.0
7 Neuroses	F40-48
8 Eating disorders	F50
9 Personality and behavioural disorders	F60-69
10 Intellectual disability	F70-79
11 Development disorders	F80-89
12 Behavioural, emotional disorders of childhood and adolescence	F90-98
13 Other and unspecified disorders	F38, F39, F51-54, F59, F99

Limitations

While every effort is made to ensure that data are of the highest quality and while the MHIS Unit engages with the mental health services and engages in continuous quality assurance activities relating to the database, a number of limitations to the data should be noted.

Any change in admissions or discharges over time or any comparisons with previous or subsequent years must be interpreted with caution and must take into account additional facilities submitting data in any given year and/or approved centres closing in any given year. In 2013, two additional in-patient facilities became approved centres under the Mental Health Act 2001 and submitted data to the NPIRS in 2013, while two centres were removed from the Register of Approved Centres. In addition, as mentioned earlier, data presented by the MHC and that presented here may differ due to reasons already outlined and, thus, comparisons between both sets of data must be interpreted with caution.

Comparison of rates over time should also be interpreted with caution given the change in the population base used to calculate rates over the years. From 2006, it was decided to revert to using the total population for the calculation of rates as this is the standard used internationally, allowing for comparability of rates across countries. For this reason, Table 2.2 presents rates of all and first admissions for 1965–2013 per 100,000 total population, allowing comparability of Irish rates over time.

Population rates for public catchment areas are calculated on the basis of total populations and, accordingly, include privately insured persons who are more likely to use private services. Since the proportion of privately medically insured persons differs between catchment areas, rates will be inflated in some catchments with a high proportion of such persons who do not depend on public services. As, for the moment, we are unable to adjust for this inflation of denominator catchment populations, comparison of rates between catchments should be done with caution.

As some services do not provide a preliminary diagnosis on admission, but rather supply diagnoses on discharge, diagnostic data on admissions not discharged by the end of the year during which they have been admitted are not available for those services. In these instances, a number of admissions have been returned with unspecified diagnoses and, therefore, the 'Other and unspecified' diagnostic category includes those with an unspecified mental disorder (F99) and those for whom no diagnosis had been assigned at the time of submission of data to the MHIS Unit. A number of hospitals also indicated having difficulty obtaining diagnoses for admissions/discharges from medical personnel and this is also reflected in the number of admissions/discharges returned with unspecified diagnoses. It is particularly disappointing that some hospitals continue to report this problem despite on-going

requests and the increasing emphasis on evidence-based information to inform service planning and delivery. This will inevitably affect the rates reported for diagnosis and, in particular, tables relating to individual units and hospitals and their respective catchment areas.

The collection of information relating to socio-economic group continues to pose a major problem for many units and hospitals. In 2013, 44% of occupations were returned as unknown, rendering assignment to a socio-economic group impossible. This should be borne in mind when interpreting tables and figures relating to socio-economic group.

The issue of recording data on patients who are transferred between units and hospitals has been a continuing problem for many hospitals. The difficulties have been accentuated by the increasing number of catchment areas where general hospital psychiatric units operate and the psychiatric hospital remains open in the same catchment and transfers occur between the two. This is in addition to transfers from one catchment area to another and of the small number of transfers to the CMH. Transfers to general hospitals for medical, surgical or other treatment are not required for HRB reporting purposes as this would lead to the loss of valuable length-of-stay information given that, while in the general hospital, patients, unless discharged, on legal grounds remain 'on the books' of the transferring hospital.

Section 14(2) of the Mental Health Act 2001 requires a patient/person presenting with an application and recommendation for involuntary admission to be examined by a consultant psychiatrist within 24 hours. At this examination, some may be deemed not to have a mental illness or a mental illness not warranting admission; some may be admitted voluntarily even though in most cases the consultant completes the admission order and the patient is admitted involuntarily. Although patients may be allowed home following examination, such patients may have been recorded as having been admitted, albeit for a short period of time, i.e. less than 24 hours. Such persons may be reflected in the admission figures in this report, although it is likely that the numbers are small. From 2009, the NPIRS Team has requested that persons should only be returned as admitted when the admission order is made or they have been admitted voluntarily; those not admitted following examination by a consultant within 24 hours should not be recorded as an admission.

Admissions and discharges represent episodes or events rather than persons. Thus, one person may have several admissions during the course of a year and each admission is recorded separately. Admissions do not necessarily represent incidence of mental illness but rather the activity of in-patient services. Throughout the country there may be considerable differences in admission rates from service to service, but this does not necessarily indicate variations in incidence and may simply reflect differing admission practices.

2 National and Regional (HSE) Admissions, Discharges and Deaths

National all and first admissions

There were 18,457 admissions to Irish psychiatric units and hospitals in 2013, representing a rate of 402.3 per 100,000 total population (Table 2.1 and Table 2.2). This is an increase of 284 admissions from 2012 (18,173) and also a slight increase in the rate of admissions from 396.1 in 2012 to 402.3 in 2013. There was a decrease in the number of first admissions from 6,130 in 2012 to 6,055 in 2013. The rate of first admissions similarly decreased from 133.6 per 100,000 in 2012 to 132.0 in 2013. Re-admissions increased from 12,043 in 2012 to 12,402 in 2013, with the proportion of admissions that were re-admissions also increasing ever so slightly from 66% in 2012 to 67% in 2013. The re-admission rate increased from 262.5 per 100,000 in 2012 to 270.3 in 2013.

Approved centres reported an additional ten persons presenting for admission in 2013 who were not subsequently admitted but were referred/returned home.

Admission numbers reached a peak of 29,392 in 1986 but have been declining steadily since then (Figure 2.1 and Table 2.1). There has been a 17% decline in admissions in the ten-year period from 2004–2013, from 22,400 in 2004 to 18,457 in 2013. Re-admissions have shown a greater level of decline during this period, at 24%, from 16,232 in 2004 to 12,402 in 2013. The overall number of first admissions has not changed greatly over the last 40 years or so, with a mere 2% decline from 2004–2013, from 6,168 in 2004 to 6,055 in 2013.

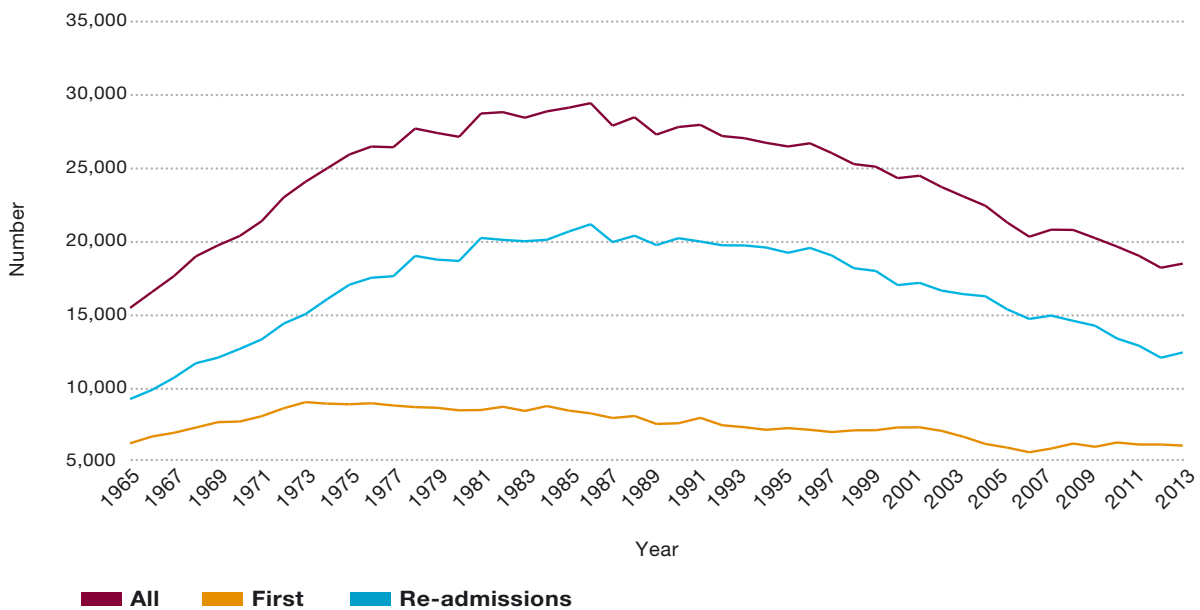

Figure 2.1 All, first and re-admissions. Ireland 1965–2013. Numbers

Gender and age

For the first time in many years the proportion of females, at 51%, slightly outnumbered that of males, at 49%, with a similar pattern observed for rates, with females having a higher rate than males, at 403.7 per 100,00 compared with 400.8 for males (Table 2.3).

The 55–64 year age group had the highest rate of all admissions, at 590.1 per 100,000, followed by the 45–54 year age group, at 587.2, and the 65–74 year age group, at 546.5 (Table 2.3). The 75 and over age group had the lowest rate of all admissions, at 450.2 per 100,000. The 18–19 year age group had the highest rate of first admissions, at 263.3, followed by the 20–24 year age group, at 237.5, and the 75 year and over group, at 194.3 per 100,000. The mean age at admission was 45 years (minimum 14 years and maximum 97 years).

Marital status

Single persons accounted for over half (55%) of all admissions, married persons accounted for 27%, widowed accounted for 4% and divorced persons also accounted for 4%. Despite accounting for just 4% of all admissions, divorced persons had the highest rate of all admissions, at 787.3 per 100,000, followed by widowed persons, at 416.1 and single persons, at 407.7 (Table 2.4). Married persons had the lowest rate of all admissions, at 288.9 per 100,000. Similarly, married persons had the lowest rate of first admissions, at 108.0 per 100,000, while divorced persons had the highest rate, at 175.5.

Females who were married (325.7), widowed (417.0) or divorced (859.4) had higher rates of all admissions than their male counterparts (252.3 for married males; 413.2 for widowed males; 693.2 for divorced males), while males who were single (435.8) had higher rates than single females (377.6).

Socio-economic group

As in previous years, the unskilled occupational group had the highest rate of all (802.2) and first admissions (211.9) (Table 2.5). However, it is worth noting that 44% of occupations were returned as unknown or unspecified, making assignment to a socio-economic group impossible. Manual skilled workers had the second-highest rate of all admissions, at 356.1 per 100,000, followed by semi-skilled workers, at 331.1. Employers and managers had the lowest rate of all admissions, at 86.7. Manual skilled workers also had the second-highest rate of first admissions, at 116.1 per 100,000, followed by semi-skilled workers, at 99.0. As with all admissions, employers and managers had the lowest rate of first admissions, at 29.9 per 100,000.

Principal economic status

Forty per cent of all admissions in 2013 were returned as unemployed, 26% as employed, 10% as retired, 6% as students, 6% as engaged in house duties, while 12% were returned as unknown.

Ethnicity

Eighty-eight per cent of all admissions in 2013 were returned as 'White Irish', 5% were returned as 'Any Other White Background' (including White Irish Traveller, White Roma and Any Other White Background) and 2% were distributed amongst various other ethnic groups. Five per cent were returned as 'Unknown/unspecified'.

Primary admission diagnosis

Depressive disorders were the most common diagnoses recorded for all admissions, accounting for 28% of all, 30% of first and 28% of re-admissions, and accounting for the highest rate of all (114.5) and first (39.8) admissions (Table 2.6a and Table 2.6b). Schizophrenia accounted for 20% of all, almost 13% (12.5%) of first and 24% of re-admissions and had the second-highest rate of all admissions (80.4). Mania accounted for 11% of all, almost 7% (6.5%) of first and 14% of re-admissions and had the third-highest rate of all admissions, at 45.4 per 100,000. Alcoholic disorders accounted for 8% of all, almost 10% (9.5%) of first and 7% of re-admissions. Neuroses had the second-highest rate of first admissions, at 16.7 per 100,000.

Eighty-one per cent of all admissions for mania were re-admissions, 79% of all admissions for schizophrenia and 76% of all admissions for personality and behavioural disorders were re-admissions (Table 2.6b).

Females had higher rates of all admissions for depressive disorders, at 127.2 per 100,000, compared with 101.6 for males, while rates of first admissions for males and females for depressive disorders were almost equal, at 39.5 for males and 40.2 for females (Table 2.6a). Males had higher rates of all and first admissions for schizophrenia than females, with rates of 94.6 for all and 19.2 for first admissions for males and rates of 66.6 for all and 14.0 for first admissions for females.

Legal status

Eleven per cent of all and 12% of first admissions were involuntary, a marginal increase in the proportion of involuntary first admissions from 11% (10.9%) in 2012. The rate of involuntary all admissions increased from 41.9 in 2012 to 44.4 per 100,000 in 2013, while that for first admissions also increased from 14.5 in 2012 to 15.7 per 100,000 in 2013 (Table 2.7b). The introduction of the Mental Health Act (2001) led to a decrease in the proportion of admissions that were involuntary such that in 2008, 7.6% of all and 8.1% of first admissions were involuntary. Since then the proportion of admissions that are involuntary has been increasing slightly each year to 11% of all and 12% (11.8%) of first admissions in 2013. Admissions for schizophrenia had the highest rate of involuntary admission, at 19.4 per 100,000, followed by mania, at 7.9, and depressive disorders, at 4.7 (Table 2.8).

It should be noted that data on legal status differ from that reported by the MHC. Data in this report do not include data on admission orders to detain voluntary patients, whereas data reported by the MHC include such admission orders.

No fixed abode

There were 245 admissions with no fixed abode in 2013. Sixty-eight per cent of these were male, 79% were single, 28% had a diagnosis of schizophrenia, 18% had a diagnosis of other drug disorders and 13% had a diagnosis of alcoholic disorders.

National discharges and deaths

There were 18,335 discharges from, and 144 deaths in, Irish psychiatric units and hospitals in 2013 (Table 2.9). Males accounted for 57% of all deaths in 2013, and 78% of those who died were aged 65 years and over (Table 2.10).

Ninety-two per cent of all those admitted in 2013 and 94% of first admissions in 2013 were discharged in 2013.

Length of stay

Almost one-third (30.3%) of all discharges took place within one week of admission, 18% occurred within one to two weeks of admission, 20% occurred within two to four weeks of admission and a further 26.5% occurred within one to three months of admission (Table 2.11). Overall, ninety-five per cent were discharged within three months of admission.

Over half of discharges (51%) with a primary discharge diagnosis of other drug disorders, 50% of discharges with behavioural and emotional disorders of childhood and adolescence and 48% of those with personality and behavioural disorders occurred within one week of admission (Table 2.11). Over 90% of discharges for most disorders occurred within three months of admission with the exception of organic mental disorders (82%), and intellectual disability (74%) (Table 2.11).

Thirty-two per cent of discharges in 2013 who were admitted voluntarily occurred within one week of admission, compared with 16% of discharges who were admitted involuntarily (Table 2.12). Just over half (50.5%) of discharges in 2013 who were admitted voluntarily were discharged within two weeks, compared with 28% of those discharged who were admitted involuntarily.

In-patient days

Table 2.13a presents analysis of in-patient days for all discharges, including deaths, and Table 2.13b presents a similar analysis for lengths of stay up to one year. In Table 2.13b, 1.3% of all discharges (234 discharges out of 18,479) were excluded, as they distort the number of bed days considerably due to the small number of discharges with considerably long lengths of stay. This is clear from the difference in the average length of stay in both tables: the average length of stay for all discharges in 2013 was 71.4 days, while that for discharges up to one year in hospital was 25.3 days, with a median length of stay of 14 days for both analyses.

Average length of stay for all discharges was longest for intellectual disability, at 1,713.5 days (median 12 days), accounting for less than one per cent of all discharges and 15% of all in-patient days. Behavioural and emotional disorders of childhood and adolescence had the second-longest average length of stay, at 595.5 days (median 6.5 days), accounting for just 0.1% of all discharges and 1% of all in-patient days. Other drug disorders had the shortest average length of stay for all discharges, at 15.4 days (median 6 days).

Discharges with a primary discharge diagnosis of organic mental disorders had the longest average length of stay (excluding discharges with a length of stay of one year or more), at 41.6 days (median 20 days), accounting for 5% of in-patient days and just 3% of discharges in 2013 (Table 2.14b). Eating disorders had the second-longest average length of stay, at 38.6 days (median 27 days), accounting for 2% of in-patient days and 1% of discharges in 2013. Other drug disorders had the shortest average length of stay at 13.6 days (median 6 days).

Health Service Executive (HSE) Areas

All and first admissions

Twenty-eight per cent of all admissions were resident in Dublin Mid-Leinster, almost 25% (24.5%) were resident in HSE West, 24% were resident in HSE South and 22% were resident in Dublin North-East. Less than one per cent of admissions were recorded as non-residents on admission.

HSE West had the highest rate of all admissions, at 418.0 per 100,000, followed by Dublin North-East, at 407.5, and HSE South, at 396.8 (Table 2.15). Dublin Mid-Leinster had the lowest rate of all admissions, at 386.3 per 100,000. Dublin North-East had the highest rate of first admissions, at 137.2 per 100,000, followed by Dublin Mid-Leinster, at 133.5, and HSE South, at 129.8. HSE West had the lowest rate of first admissions, at 123.7 per 100,000.

The proportion of admissions that were re-admissions ranged from 70% for admissions resident in HSE West to 66% of admissions resident in Dublin North-East (Table 2.15). HSE West had the highest rate of re-admissions, at 294.3 per 100,000, followed by Dublin North-East, at 270.4, and HSE South, at 267.0. Dublin Mid-Leinster had the lowest rate of re-admissions, at 252.8 per 100,000.

Gender and age

Females had higher rates of all admissions than males in Dublin Mid-Leinster and Dublin North-East, with rates of 401.0 and 418.5 respectively, compared with rates of 371.1 for males in Dublin Mid-Leinster and 396.3 in Dublin North-East (Table 2.15). Males had higher rates of all admissions than females in HSE South, at 411.0 and HSE West, at 426.4, compared with 382.7 per 100,000 for females in HSE South and 409.6 in HSE West. Males had higher rates of first admissions than females in all HSE areas ranging from 145.3 per 100,000 in Dublin North-East to 127.9 in HSE West.

In Dublin Mid-Leinster the highest all admission rate was in the 55–64 year age group, at 621.6 per 100,000, as it was in Dublin North-East, at 642.7 (Table 2.16). The highest rate in HSE South was in the 20–24 year age group, at 595.1 per 100,000, and also in HSE West, at 664.6. In Dublin Mid-Leinster the highest first admission rate was in the 18-19 year age group, at 251.7 per 100,000, as it was in Dublin North-East, at 282.7, and in HSE West, at 298.7 (Table 2.17). The 20–24 year age group had the highest rate of first admission in HSE South, at 264.5 per 100,000.

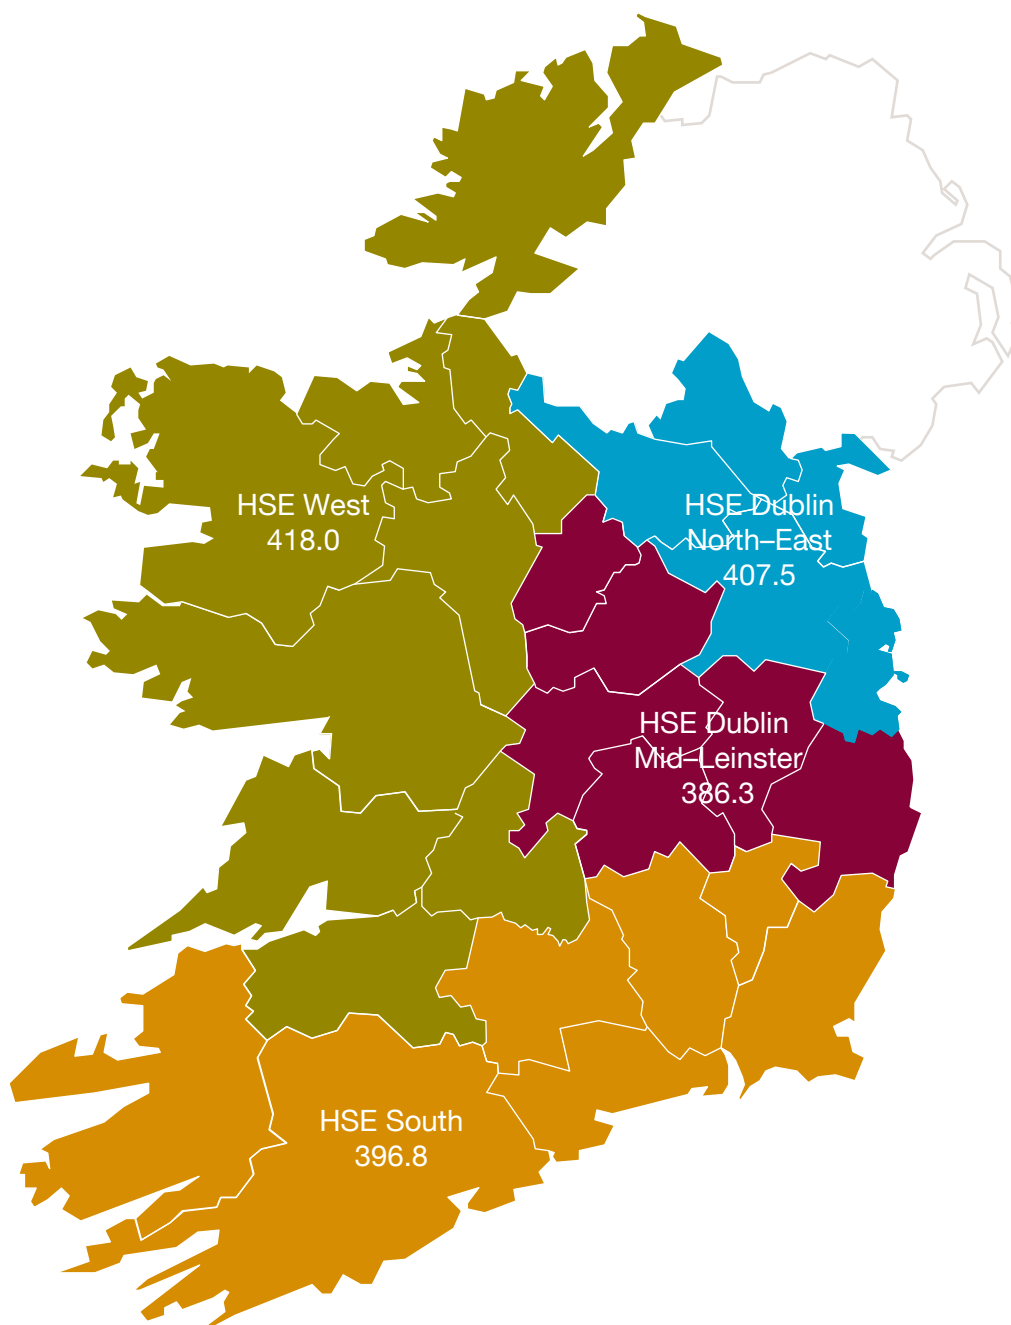

Figure 2.2 Health Service Executive Areas. All admissions. Ireland 2013.
Rates per 100,000 total population

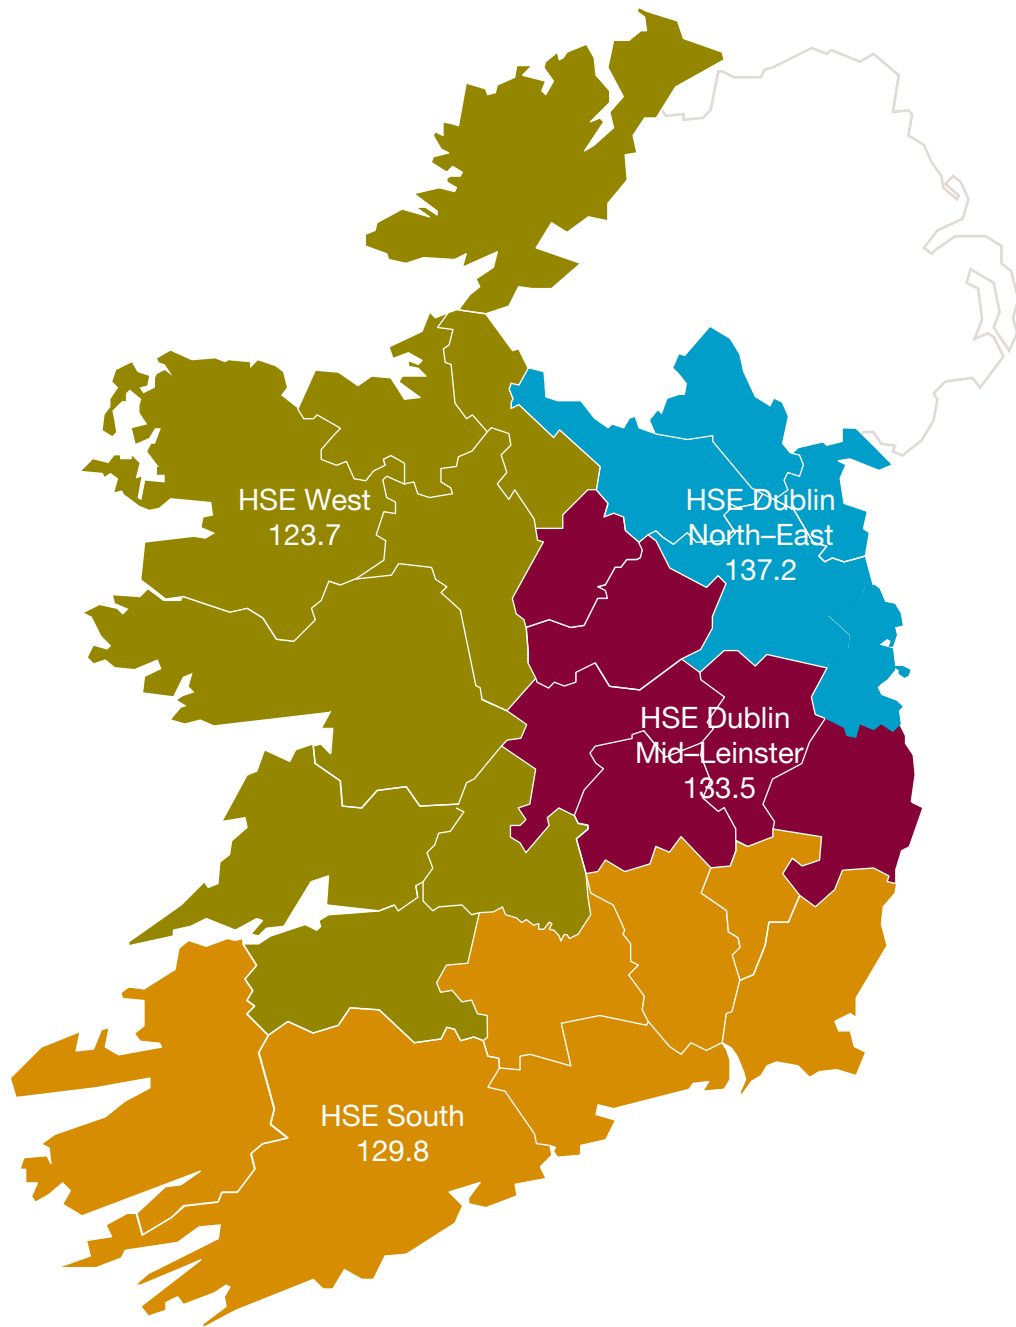

Figure 2.3 Health Service Executive Areas. First admissions. Ireland 2013.
Rates per 100,000 total population

Age groups were condensed into two distinct groups, under 45 years and 45 years and over. The 45 years and over group had the highest rate of admissions in all HSE areas, with rates ranging from 617.2 in Dublin North-East to 514.4 in HSE South (Figure 2.4). Rates for the under 45 year group ranged from 358.6 in HSE West to 285.1 in Dublin Mid-Leinster.

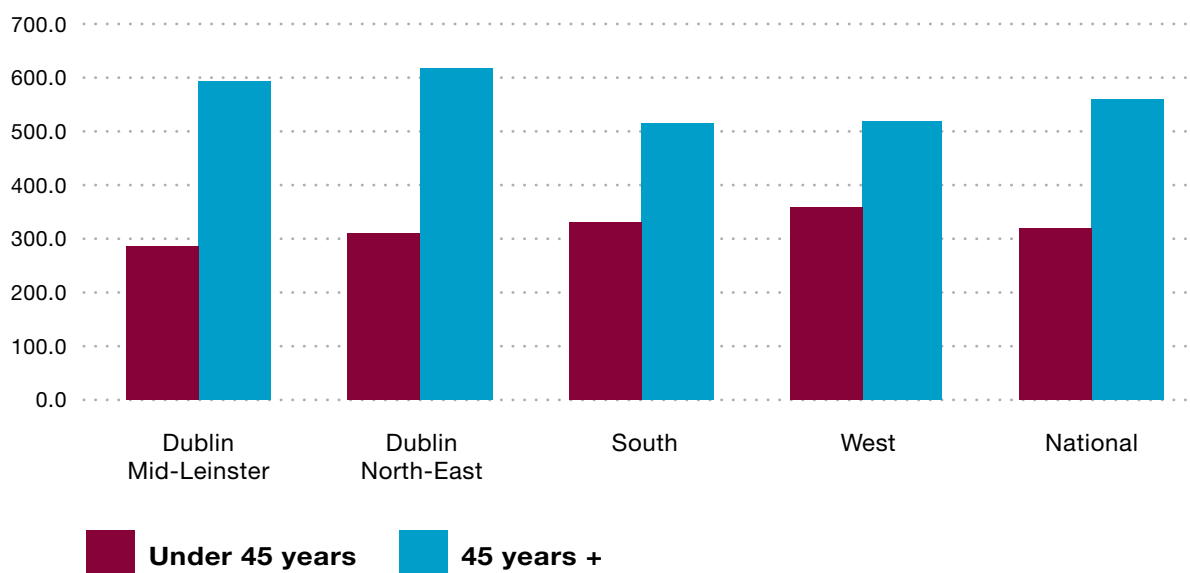

Figure 2.4 Health Service Executive Areas. All admissions by age category. Ireland 2013. Rates per 100,000 total population

Marital status

Divorced persons had the highest rate of all admissions in all four HSE areas, with rates ranging from 1,115.9 per 100,000 in Dublin North-East to 600.9 in HSE South (Table 2.18). Married persons had the lowest rate of admissions in all HSE areas with rates ranging from 306.0 in Dublin Mid-Leinster to 277.7 in HSE West. Divorced persons had the highest rate of first admissions in Dublin North-East, at 266.4 per 100,000, HSE South, at 174.9, and HSE West, at 128.2, while widowed persons had the highest rate of first admissions in Dublin Mid-Leinster, at 162.4 per 100,000.

Socio-economic group¹

Non-manual occupations accounted for the highest proportion of all and first admissions in each HSE area, with all admissions ranging from 17% in Dublin Mid-Leinster to 14% in Dublin North-East (Table 2.19). Proportions for first admissions ranged from 17% in Dublin Mid-Leinster to 13% in Dublin North-East (Table 2.20). However, the data relating to socio-economic group should be interpreted with caution as 44% of all occupations were returned as unknown or unspecified thus making assignment to a socio-economic group impossible.

¹ Rates for socio-economic group by HSE areas could not be calculated for 2013 as the breakdown by persons was not produced in the Small Area Population Statistics for 2011. The data produced for EDs related to the socio-economic group of the reference person and household rather than every person resident in the state on census night. Thus, it was not possible to calculate the socio-economic group for the total population for each HSE area.

Primary admission diagnosis

Depressive disorders had the highest rate of all and first admissions across all four HSE areas in 2013. Rates for all admissions ranged from 136.4 per 100,000 in HSE West to 100.9 in Dublin North-East (Table 2.21 and Figure 2.5), while first admissions rates ranged from 46.5 in HSE West to 34.6 in Dublin North-East (Table 2.22 and Figure 2.6). Rates of all admissions for schizophrenia were second-highest amongst all HSE areas with rates ranging from 83.5 per 100,000 in HSE West to 78.3 in Dublin Mid-Leinster (Table 2.21).

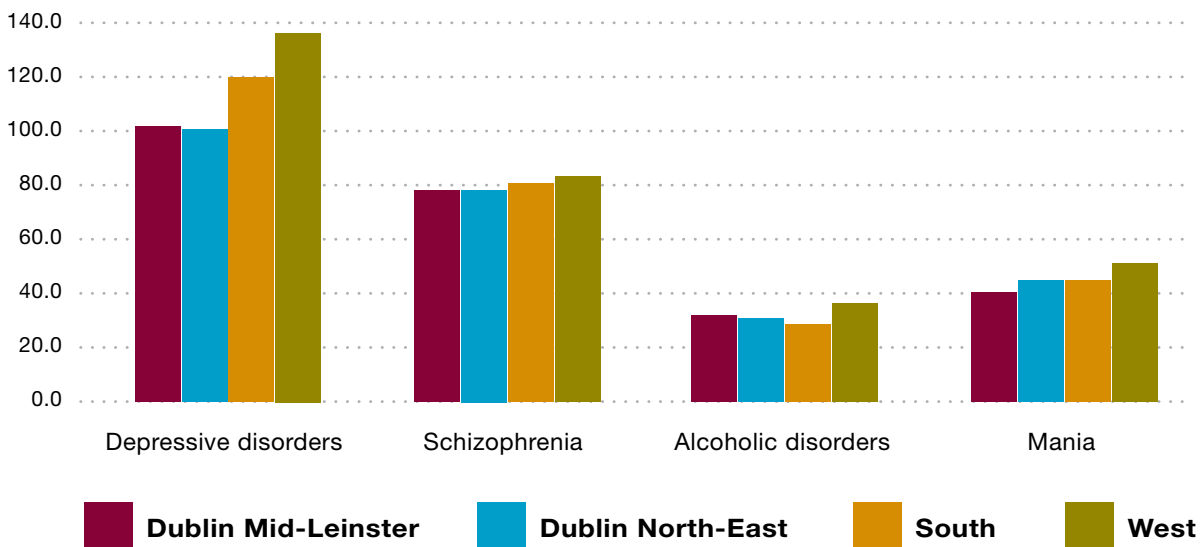

Figure 2.5 Health Service Executive Areas. All admissions by selected diagnoses. Ireland 2013. Rates per 100,000 total population

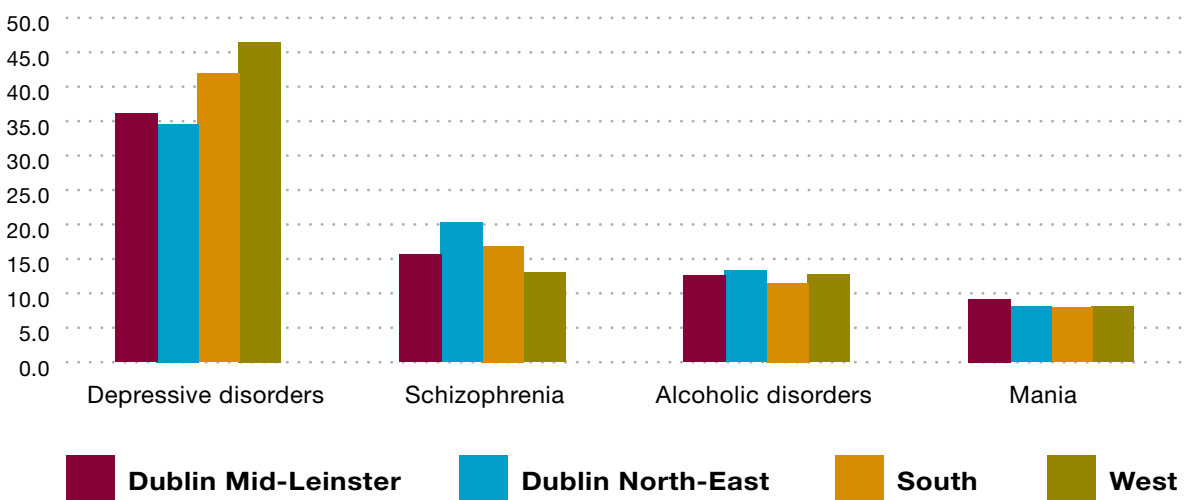

Figure 2.6 Health Service Executive Areas. First admissions by selected diagnoses. Ireland 2013. Rates per 100,000 total population

Legal status

Twelve per cent of all admissions resident in Dublin North-East were involuntary, 11% in HSE South and 11% in HSE West and 10% in Dublin Mid-Leinster were involuntary (Table 2.23). Fourteen per cent (13.6%) of first admissions in Dublin North-East, almost 14% (13.5%) in HSE South, 10% in Dublin Mid-Leinster and 10% in HSE West were involuntary (Table 2.23).

The highest rate of involuntary all admissions was observed for Dublin North-East, at 48.7 per 100,000, followed by HSE West, at 45.3, HSE South, at 44.8, and Dublin Mid-Leinster, at 39.0 (Table 2.23). Dublin North-East also had the highest rate of involuntary first admissions, at 18.7 per 100,000, followed by HSE South, at 17.6, Dublin Mid-Leinster, at 13.5, and HSE West, at 12.3.

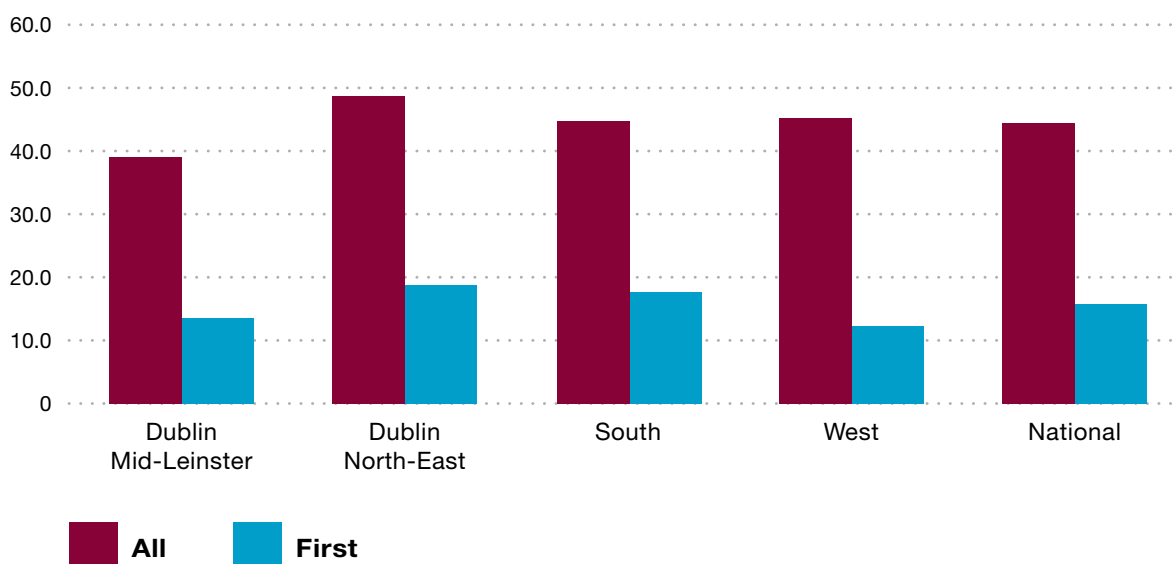

Figure 2.7 Health Service Executive Areas. All and first involuntary admissions. Ireland 2013. Rates per 100,000 total population

Length of stay

Almost one-third of all discharges in each HSE area in 2013 occurred within one week of admission (Table 2.24): 31% in HSE South, 31% in HSE West, almost 31% (30.5%) in Dublin North-East and almost 30% (29.5%) in Dublin Mid-Leinster. Seventy-three per cent of discharges for HSE West, 69% in HSE South, 66% in Dublin North-East and 65% in Dublin Mid-Leinster occurred within one month of admission (Table 2.24). Over 94% of discharges in all areas occurred within three months of admission.

Average length of stay for all discharges was longest in Dublin North-East, at 100.8 days (median 14 days), followed by HSE South, at 76.3 days (median 14 days), and Dublin Mid-Leinster, at 65.1 days (median 16 days) (Table 2.26a). HSE West had the

shortest average length of stay for all discharges, at 47.7 days (median 13 days). When discharges of one year or more were excluded, average length of stay was longest for Dublin Mid-Leinster, at 27.0 days (median 16 days), followed by Dublin North-East, at 26.1 days (median 14 days), and HSE South, at 25.0 days (median 14 days) (Table 2.26b). HSE West had the shortest average length of stay for discharges up to one year, at 23.0 days (median 13 days).

Counties

All and first admission rates by county of residence are presented in Table 2.27a and Table 2.27b along with Figure 2.8 and Figure 2.9. Admissions for non-residents (54) were excluded from the analysis. There were wide variations in admission rates between counties in 2013. All admission rates were highest for counties Sligo (516.9), Roscommon (496.4), Kerry (468.0) and Laois (465.5) (Table 2.27a and Figure 2.8). Monaghan had the lowest rate of all admissions, at 188.5 per 100,000, followed by Cavan, at 211.8, and Wexford, at 314.5. Westmeath had the highest rate of first admissions, at 164.8 per 100,000, followed by Dublin, at 148.9, Laois, at 147.7, and Kerry, at 145.0 (Table 2.27b and Figure 2.9). Monaghan had the lowest rate of first admissions, at 61.2 per 100,000, followed by Cavan, at 76.5, and Meath, at 98.3.

Primary admission diagnosis

Mayo had the highest rate of all admissions for depressive disorders, at 267.9 per 100,000, followed by Tipperary North, at 172.1, Roscommon, at 138.9, and Cork, at 132.9 (Table 2.27a). Monaghan had the lowest rate of all admissions for depressive disorders, at 38.0 per 100,000.

Sligo had the highest rate of all admissions for schizophrenia, at 137.6 per 100,000, followed by Leitrim, at 122.6, Kerry, at 117.5, and Laois, at 115.4 (Table 2.27a). Carlow had the lowest rate of all admissions for schizophrenia, at 42.1 per 100,000.

Admissions from Leitrim had the highest rate of all admissions for alcoholic disorders, at 81.8 per 100,000, followed by Donegal, at 63.9, Kerry, at 46.7, and Dublin, at 40.1 (Table 2.27a). Offaly had the lowest rate of all admissions for alcoholic disorders, at 6.5.

Admissions from Mayo had the highest rate of first admissions for depressive disorders, at 100.3 per 100,000 followed by Tipperary North, at 59.7, Kerry, at 55.7, and Cork, at 52.0 (Table 2.27b). Monaghan had the lowest rate of first admissions for depressive disorders, at 14.9 per 100,000.

Louth had the highest rate of first admissions for schizophrenia, at 25.2 per 100,000, followed by Kerry, at 23.4, Galway, at 21.5, and Cork, at 20.6 (Table 2.27b). Tipperary North had the lowest rate of first admissions, at 1.4 per 100,000.

First admissions from Leitrim had the highest rates of admission for alcoholic disorders, at 28.3 per 100,000, followed by Longford, at 20.5, Kerry, at 19.9 and Donegal, at 18.0 (Table 2.27b). Tipperary South had the lowest rate of first admissions for alcoholic disorders, at 1.1 per 100,000.

Non-residents

The designation of persons as non-resident is determined by the address given by them on admission and it is therefore likely to represent persons who have recently arrived in the country.

There were 54 admissions for non-residents in 2013, no change from 2012. Thirty-nine per cent of admissions for non-residents had an address originating in Northern Ireland, 30% had an address originating in England, 11% in the USA, 4% in France and 4% in Germany, with the remaining distributed amongst various other countries (Table 2.28). Twenty-six per cent of non-residents had a primary diagnosis of schizophrenia, 24% had a diagnosis of mania, 20% had a diagnosis of depressive disorders and 7% had a diagnosis of personality and behavioural disorders (Table 2.29).

3 Hospital Type – Admissions, Discharges and Deaths

In 2013, 56% (55.6%) of all admissions were to general hospital psychiatric units, 24% were to independent/private and private charitable centres and 20% were to psychiatric hospitals/continuing care units (including the Central Mental Hospital, Dundrum; Carraig Mór, Cork; St Joseph’s Intellectual Disability Service, Portrane; and Phoenix Care Centre, Dublin) (Table 3.1 and Figure 3.1). There was a slight decrease in admissions to general hospital psychiatric units from 2012–2013 (56.5% to 55.6%), a decrease in admissions to psychiatric hospitals/continuing care units from 22% in 2012 to 20% in 2013, and an increase in admissions to independent/private and private charitable centres from 22% in 2012 to 24% in 2013. In the ten-year period from 2004–2013 admissions to general hospital psychiatric units increased from 47% to 56%, admissions to independent/private and private charitable centres increased from 18% to 24%, while admissions to psychiatric hospitals/continuing care units decreased from 35% to 20%

Re-admissions accounted for 69% of all admissions to psychiatric hospitals/continuing care units, 67% of all admissions to general hospital psychiatric units and 66% of all admissions to independent/private and private charitable centres (Table 3.1).

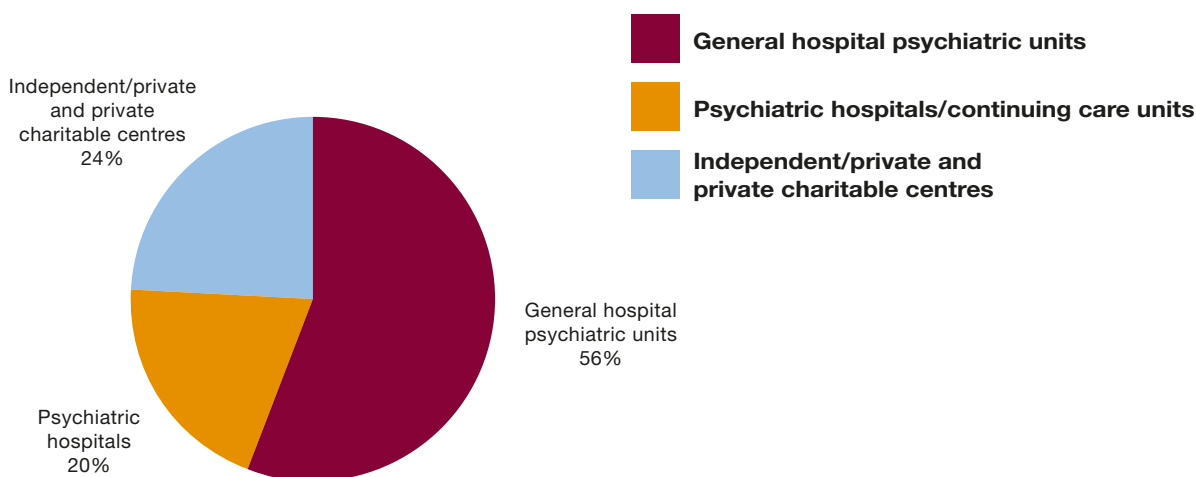

Figure 3.1 Hospital type. All admissions. Ireland 2013. Percentages

Gender and age

Males accounted for over half of all and first admissions to general hospital psychiatric units and psychiatric hospitals/continuing care units; 52% of all admissions and 56% of first admissions to general hospital psychiatric units; 54% of all admissions and almost 57% (56.5%) of first admissions to psychiatric hospital/continuing care units (Table

3.1). In contrast, 61% of all admissions to independent/private and private charitable centres were female and 58% of first admissions were female.

As in previous years, admissions to independent/private and private charitable centres had an older age profile than either general hospitals psychiatric units or psychiatric hospitals/continuing care units; 60% of admissions to independent/private and private charitable centres were aged 45 years and over compared with 43% in general hospitals psychiatric units and 48% in psychiatric hospitals/continuing care units (Table 3.2). The mean age at admission in independent/private and private charitable centres was 49.5 compared with 45.3 in psychiatric hospitals/continuing care units and 42.9 in general hospital psychiatric units.

Marital status

Single persons accounted for 61% of all admissions to general hospital psychiatric units, 55% of admissions to psychiatric hospitals/continuing care units and 40% of admissions to independent/private and private charitable centres (Table 3.3). In contrast, 44% of admissions to independent/private and private charitable centres were married compared with 22% in general hospital psychiatric units and 19% in psychiatric hospitals/continuing care units.

Socio-economic group

Almost 29% (28.5%) of all admissions to independent/private and private charitable centres were for higher and lower professional combined, compared with 8% to general hospital psychiatric units and 6% (5.6%) to psychiatric hospitals/continuing care units (Table 3.4). Twenty-one per cent of all admissions to independent/private and private charitable centres had non-manual occupations, 16% of admissions to general hospital psychiatric units and 9% of admissions to psychiatric hospitals/continuing care units had non-manual occupations.

Socio-economic groups were categorised into two distinct groups, manual and non-manual occupations and there were clear differentials in admissions to the different types of hospitals for the two groups. Eighty-three per cent of admissions to independent/private and private charitable centres were for non-manual occupations, compared with almost 53% (52.5%) to psychiatric hospitals/continuing care units and 50% to general hospital psychiatric units (Figure 3.2).

2 Manual occupations include agricultural workers, manual skilled, semi-skilled and unskilled. Non-manual occupations include higher professional, lower professional, employers and managers, own account workers and non-manual workers. Farmers and unspecified occupations have been excluded from this classification.

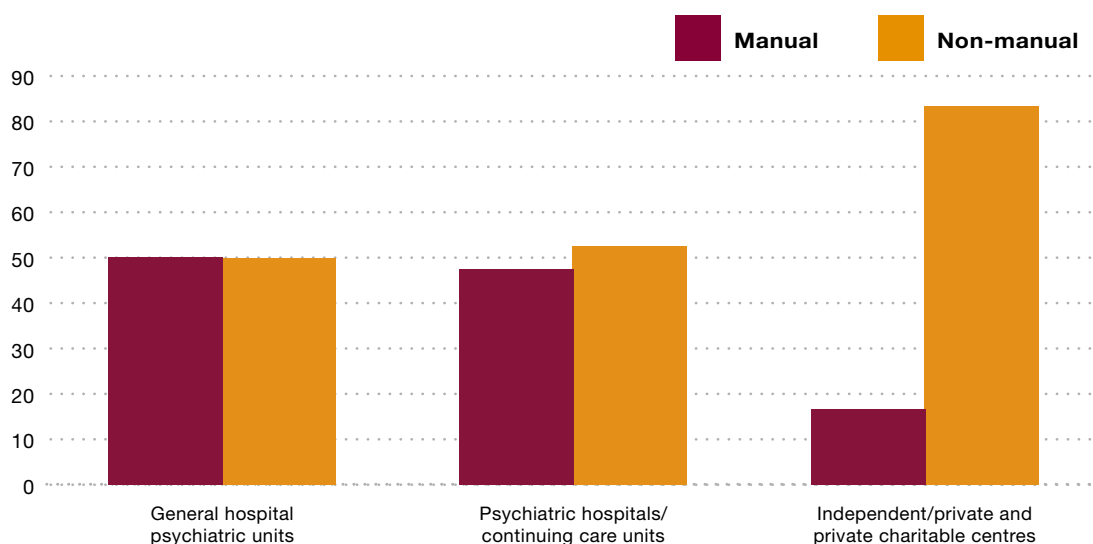

Figure 3.2 Hospital type. All admissions by manual and non-manual occupations. Ireland 2013. Percentages

Primary admission diagnosis

Over one-third of all (35%) and first (32%) admissions to independent/private and private charitable centres had a primary admission diagnosis of depressive disorders (Table 3.6 and Table 3.7). The comparable figures for general hospital psychiatric units were 29% of all and 32% of first, while those for psychiatric hospitals were 20% of all and 24% of first admissions.

A much lower proportion of admissions to independent/private and private charitable centres were for schizophrenia (7%), compared with 23% of admissions to general hospital psychiatric units and 28% of admissions to psychiatric hospitals/continuing care units (Table 3.6). Fifteen per cent of all admissions to independent/private and private charitable centres had a primary diagnosis of neurosis, compared with 7.5% of admissions to general hospital psychiatric units and 6% of admissions to psychiatric hospitals/continuing care units. Alcoholic disorders accounted for 13% of admissions to independent/private and private charitable centres, 7% of admissions to general hospital psychiatric units and 5% of admissions to psychiatric hospitals/continuing care units.

Legal status

There were considerable disparities between hospital types for involuntary admissions. Nineteen per cent of all admissions to psychiatric hospitals/continuing care units, 12% to general hospital psychiatric units were involuntary, compared with just 2% to independent/private and private charitable centres (Table 3.8). The pattern for

involuntary first admissions was similar, with almost 23% (22.5%) to psychiatric hospitals/continuing care units, 12% to general hospital psychiatric units and just 2.5% to independent/private and private charitable centres.

Length of stay

Over one-third of all discharges from both general hospital psychiatric units (36%) and psychiatric hospitals (34%) occurred within one week of admission, compared with 14% from independent/private and private charitable centres (Table 3.9). Over half of all discharges from general hospital psychiatric units (57%) and from psychiatric hospitals/continuing care units (52%) occurred within two weeks of admissions compared with 25% from independent/private and private charitable centres.

Average length of stay for all discharges was longest in psychiatric hospitals/continuing care units, at 229.5 days (median 13 days), followed by independent/private and private charitable centres, at 45.9 days (median 29 days), and general hospital psychiatric units, at 23.3 days (median 11 days) (Table 3.10a). When discharges of one year or more were excluded independent/private and private charitable centres had the longest average length of stay, at 33.3 days (median 29 days), followed by psychiatric hospitals/continuing care units, at 26.6 days (median 11.5 days), and general hospital psychiatric units, at 21.4 days (median 11 days) (Table 3.10b).

4 Individual Units and Hospitals – Admissions, Discharges and Deaths

This chapter presents data on individual units and hospitals, along with data on mental health catchment areas (MHCA) and their respective rates. The catchment area breakdowns and the various electoral divisions that comprise each area were previously supplied courtesy of Health Atlas, Health Promotion Unit in the HSE, and these areas were updated using the CSO census of population for 2011. The population of most areas were confirmed with Local Health Offices (LHO), but the verification of the composition of some catchment areas still remains outstanding due to uncertainty regarding boundaries. Notwithstanding this, the numbers concerned are small and are not likely to change the rates significantly. A list of the individual units and hospitals by each catchment area is presented in Appendix 2.

As noted earlier there were two new centres added to the Register of Approved Centres under the Mental Health Act 2001; Selskar House, Farnogue Residential Healthcare Unit, Wexford; and Phoenix Care Centre, Dublin. St Brendan's Hospital Dublin and St Senan's Hospital, Enniscorthy both closed during 2013. The addition of new centres and the closure of existing centres will affect patterns in the rates for catchment areas over time and this should be borne in mind if comparing rates for such catchment areas over a particular time period.

In 2013, six beds in the Department of Psychiatry, Midland Regional Hospital, Portlaoise, were allocated to patients from Lakeview Unit, Naas General Hospital. As this report is activity-based, admissions for these patients from Lakeview Unit are included in figures for the Midland Regional Hospital, Portlaoise. Changes or items of note regarding individual units and hospitals are indicated with footnotes in Table 4.2. All tables referred to in this chapter are presented at the end of the chapter.

All and first admissions for individual catchment areas and their respective populations are presented in Table 4.1. All admission rates for catchment areas ranged from 456.6 per 100,000 in Dublin North to 142.1 in Cluain Mhuire catchment area. Rates for first admissions ranged from 153.5 per 100,000 in Dublin North to 10.9 in the Cluain Mhuire catchment area.

The number of admissions to individual units and hospitals for 2012 and 2013, along with the difference and percentage change from 2012 to 2013 are presented in Table 4.2. Admissions to general hospital psychiatric units remained unchanged from 2012

(10,277) to 2013 (10,278), while admissions to psychiatric hospitals/continuing care units fell by 167 and admissions to independent/private and private charitable centres increased by 450 admissions, from 3,961 in 2012 to 4,411 in 2013.

Primary admission diagnosis by catchment area

All and first admission rates for each catchment area by primary admission diagnosis are presented in Table 4.3 and Table 4.4. All admission rates for depressive disorders were highest in Mayo, at 251.1 per 100,000, followed by North Lee, at 170.0, and Roscommon, at 114.1 (Table 4.3). Cluain Mhuire had the lowest rate of all admissions for depressive disorders, at 19.6 per 100,000.

Admission rates for schizophrenia were highest in Sligo/Leitrim, at 135.6 per 100,000, followed by West Galway, at 132.6, and Dublin South East, at 129.6 (Table 4.3). North Cork had the lowest rate of all admissions for schizophrenia, at 33.5 per 100,000.

Donegal had the highest rate of all admissions for alcoholic disorders, at 61.9 per 100,000, followed by North Lee, at 40.2, and Sligo/Leitrim, at 39.9 (Table 4.3). North County Dublin had the lowest rate of all admissions for alcoholic disorders, at 0.8 per 100,000.

As with all admissions, first admission rates for depressive disorders were highest in Mayo, at 91.9 per 100,000, followed by North Lee, at 62.2, and Kerry, at 46.0 (Table 4.4). Cluain Mhuire had the lowest rate of first admissions for depressive disorders, at 1.6 per 100,000.

First admission rates for schizophrenia were highest in Dublin North-West, at 32.1, followed by Dublin South East, at 30.3, and West Galway, at 30.1. Cluain Mhuire had the lowest rate of first admissions for schizophrenia, at 3.3 per 100,000.

Donegal had the highest rate of first admissions for alcoholic disorders, at 18.4 per 100,000, followed by North Lee, at 17.1, and Dublin North West, at 16.6 (Table 4.4). North County Dublin had the lowest rate of first admissions for alcoholic disorders, at 0.4 per 100,000.

Length of stay

There were great variations in length of stay on discharge across all hospitals. In some hospitals, over 40% of all discharges occurred within one week of admission; St Brigid's Hospital, Ardee (49%); Tallaght Hospital (47%); St Luke's Hospital, Kilkenny (46%); St Vincent's Hospital, Fairview (46%); University College Hospital Galway (45%); Newcastle Hospital, Greystones (44%); St James' Hospital (43%); St Loman's Hospital, Mullingar (42%); Naas General Hospital (41%) (Table 4.20 and Table 4.21). In contrast, the proportion of discharges within one week of admission in independent/private and private charitable centres was less than 20%; St Edmundsbury Hospital, 16%; St Patrick's Hospital, 15%; St John of God Hospital, 10%, Highfield Hospital, 8%; Lois Bridges 3%; Bloomfield Hospital, 0% within one week of admission (Table 4.22).

Table 4.23, Table 4.24 and Table 4.25 present average length of stay for individual units and hospitals for all discharges. Cavan Hospital had the longest average length of stay for all discharges, at 32.5 days (median 15 days), followed by St Vincent's University Hospital, at 30.6 days (median 21 days), and Mercy Hospital Cork, at 26.9 days (median 13 days) (Table 4.23). Discharges from University College Hospital, Galway, had the shortest average length of stay, at 17.1 days (median 8 days).

Average length of stay for psychiatric hospitals/continuing care units was considerably longer due to longer lengths of stay in some of the older psychiatric hospitals.

Averages were in excess of 3,000 days in some hospitals but the number of discharges in these cases was very small and thus skewed the averages (Table 4.24). Bloomfield Hospital had the longest average length of stay amongst the independent/private and private charitable centres, at 1,372.8 days (median 1,082), followed by Highfield Hospital, at 265.5 days (median 27 days) (Table 4.25). St Edmundsbury Hospital had the shortest average length of stay amongst the independent/private and private charitable centres, at 31.3 days (median 28 days).

5 Child and Adolescent Admissions

This chapter presents data on admissions for persons under 18 years of age to adult and dedicated child and adolescent services, regardless of the in-patient facility to which they were admitted. Thus, some admissions may have been reported on earlier in the report. However, data on admissions to dedicated child and adolescent units have not been reported on previously. These centres are Linn Dara Child and Adolescent unit, Dublin; Ginesa Unit, St John of God Hospital, Dublin; CAMHS Galway; St Joseph's Adolescent In-patient Unit, St Vincent's Hospital, Fairview; Éist Linn Child and Adolescent In-patient Unit, Cork; and Willow Grove Adolescent Unit, St Patrick's Hospital, Dublin.

All and first admissions

There were 415 admissions for under 18s in 2013 to all hospital types (general hospital psychiatric units, psychiatric hospitals/continuing care units and child and adolescent in-patient units) (Table 5.1), a decline of 23 since 2012 (438). Seventy-six per cent (317) of all admissions for under 18s were first admissions. There were 317 admissions to dedicated child and adolescent in-patient units and 74% of these (236) were first admissions (Table 5.2). There were 98 admissions for under 18s to adult psychiatric hospitals.

Gender and age

Sixty-four per cent of all and 63% of first admissions for under 18s were females (Table 5.1). Over one-third (37%) of all admissions for under 18s were aged 17 years of age on admission, almost 32% (31.5%) were aged 16 years, 15% were aged 15 years, 11% were aged 14 years, 4% were aged 13 years and 1% were aged 12 years or younger (Table 5.1).

Females accounted for 69% of all and 69% of first admissions to dedicated child and adolescent in-patient units (Table 5.2). Thirty per cent of all admissions to child and adolescent in-patient units were aged 17 years of age on admission, a further 30% were aged 16 years, 19% were aged 15 years, 14% were aged 14 years, 5% were aged 13 years and 1% were aged 12 years or younger (Table 5.2).

Of the 98 admissions to adult psychiatric units and hospitals, 56 were aged 17 years, a further 36 were aged 16 years, 3 were aged 15 years and a further 3 were aged 14 years.

Primary admission diagnosis

Thirty-six per cent of all admissions for under 18s had a primary admission diagnosis of depressive disorders, 13% had a diagnosis of schizophrenia, almost 12% (11.5%) had a diagnosis of eating disorders and 9% had a diagnosis of neuroses (Table 5.3). Females accounted for 65% of all admissions with a primary diagnosis of depressive disorders, 72% of all admissions with mania, 92% of all admissions with eating disorders and 64% of all admissions with neuroses. Males accounted for 60% of all admissions with a primary diagnosis of schizophrenia and 60% of those with other drug disorders.

Thirty-eight per cent of first admissions for under 18s had a primary admission diagnosis of depressive disorders, 12% had eating disorders, 11% had schizophrenia and 8% had neuroses. Females accounted for 65% of first admissions for under 18s with a primary admission diagnosis of depressive disorders, 92% of those with eating disorders and almost 62% (61.5%) of those with neuroses. Males accounted for 68% of first admissions for under 18s with a primary admission diagnosis of schizophrenia.

Legal status

Four per cent of all admissions (16 admissions) for under 18s were involuntary in 2013 and 3% of first admissions (9 admissions) were involuntary (Table 5.4). Forty-four per cent of all involuntary admissions for under 18s had a primary admission diagnosis of schizophrenia, 25% had a diagnosis of depressive disorders and 19% had a diagnosis of mania (Table 5.5). One-third of involuntary first admissions for under 18s had a primary admission diagnosis of schizophrenia, with a further 33% having a diagnosis of depressive disorders (Table 5.5).

Hospital type

Seventy-six per cent of all admissions for under 18s were to dedicated child and adolescent units, 20% were to general hospital psychiatric units and 3% were to psychiatric hospitals/continuing care units (Table 5.6). There were no admissions to independent/private and private charitable centres. Somewhat similar proportions were observed for first admissions; 74% to child and adolescent units, 22% to general hospital psychiatric units and 4% to psychiatric hospitals/continuing care units (Table 5.6).

Length of stay

Eighty-five per cent of under 18s admitted in 2013 were discharged in 2013. Of those admitted and discharged in 2013, 24% were discharged within one week, 10% were discharged within one to two weeks, 14% were discharged within two to four weeks, 40% were discharged within one to three months and 12% were discharged within three months to one year (Table 5.7).

The average length of stay for all under 18s admitted and discharged in 2013 was 42.5 days (median 29 days) (Table 5.8). The average length of stay for those admitted and discharged in 2013 was longest in child and adolescent units, at 54.8 days (median 48 days), followed by general hospital psychiatric units, at 9.8 days (median 4 days) and psychiatric hospitals/continuing care units, at 9.3 days (median 11 days).
